The invention relates to human polynucleotides (AA163803-AA164012) and CC the encoded proteins (AAM434497-AAM43660) useful for preventing, treating CC or ameliorating medical conditions e.g. by protein or gene therapy. The CC specification. The nucleic acids, proteins, antibodies and (ant)agonists (CC specification. The nucleic acids, proteins, antibodies and (ant)agonists (CC e.g. breast and ovarior cancer and other cancers of the adrenal gland, (CC e.g. breast and ovarior cancer and other cancers of the adrenal gland, (CC e.g. breast and ovarior cancers and other cancers of the adrenal gland, (CC croim's disease, multiple scalerosis, recumancial architis and ulcerative (CC croim's disease, multiple sclerosis, recumancial architis and ulcerative (CC colitis; (c) cardiovascular disorders such as myocardial ischaemias; (CC (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and (CC epilepsy; and (f) infections diseases such as viral, bacterial, fungal (CC and parasitic infections diseases such as viral, bacterial, fungal) (CC and parasitic infections diseases such as viral, bacterial, fungal) (CC constant) infections diseases such as viral, bacterial, fungal) (CC constant) infections diseases such as viral, bacterial, fungal) (CC and parasitic infections diseases such as viral, bacterial, fungal) (CC constant) infections diseases such as viral, bacterial, fungal) (CC constant) infections diseases such as viral, bacterial, fungal) (CC constant) infections diseases such as viral, bacterial, fungal) (CC constant) infections diseases such as viral, bacterial, fungal) (CC constant) infections diseases such as viral, bacterial, fungal) (CC constant) infections diseases such as viral, bacterial, fungal) (CC constant) infections diseases such as viral, bacterial, fungal) (CC constant) infections diseases such as viral, bacterial, fungal) (CC constant) infections diseases (

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAX98114 standard; DNA; 1341
                                                                                                                                                                                                                                                                                 The present sequence represents a Pseudomonas aeruginosa nucleic aicd sequence. P. aeruginosa is an opportunistic human pathogen present in soil water and plants. The specification describes virulence polypeptides and nucleic acid sequence encoding such polypeptides. These sequences and nucleic acid sequence encoding such polypeptides. These sequences can be used to identify a compound which is capable of decreasing the expression of a pathogenic virulence factor. Compounds that inhibit expression or activity of virulence factor polypeptides can be used to treat pathogenic infections, especially where the infection is a p. aeruginosa infection.

is a p. aeruginosa infection.

is a p. aeruginosa infection.

is a p. aeruginosa sumptions were made as to the identity of the base; in some instances assumptions were made as to the identity of the base; it is therefore possible that the sequence given below is not entirely
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human pathogen; virulence polypeptide; virulence factor; pathogenic infection; Pseudomonas aeruginosa infection;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Nucleotide sequence of ORF21421 encoding a virulence factor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        25-OCT-1999

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAX98035;
                                                                                                                                                                                                                                                                                                                                                     The present sequence represents a Pseudomonas aeruginosa nucleic aicd sequence. P. deruginosa is an opportunistic human pathogen present in sequence. P. deruginosa is an opportunistic human pathogen present in sequence and plants. The specification describes virulence polypeptides and nucleic acid sequence encoding such polypeptides. These sequences can be used to identify a compound which is capable of decreasing the expression of a pathogenic virulence factor. Compounds that inhibit the expression or activity of virulence factor polypeptides can be used to treat pathogenic infections, especially where the infection is a parameters insertice.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human pathogen; virulence polypeptide; virulence factor;

library constructed using Stratagene ZAP-cDNA syntesis kit. Oligo dr-primed, size fractionated ~1-6 kb, and directionally cloned at EcoRI and XhOI in Uni-ZAP XR. Following a single round of amplification pBlueScript SK phagemids were mass excised. A distribution channel for clones is being sought, but not currently available. Requests for clones cannot be homored.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

CC neural cell adhesion molecules. A modified direct cDNA selection collection collection molecules. A modified direct cDNA selection collection collection collection collection collection collection details. A unique cDNA fragment, designated E51 (see AAV1982), was cobtained and used to serven a trisomy 21 human foetal brain (14 wk cobtained and used to serven a trisomy 21 human foetal brain (14 wk cobtained and used to serven a trisomy 21 human foetal brain (14 wk cobtained and used to serven a trisomy 21 human foetal brain (14 wk cobtained and used to serven a trisomy 21 human foetal brain (14 wk cobtained and used to serven a trisomy 21 human foetal brain (14 wk cobtained and used to serven a trisomy 21 human foetal brain (14 wk cobtained and used to serven a trisomy 21 human foetal brain (14 wk cobtained and used to serve as deduced from coverlapping clones. A splice variant cDNA (see AAV31985), encoding coverlapping clones 900-1200 kb of genomic DNA and maps at chromosome compares spans 900-1200 kb of genomic DNA and maps at chromosome compares (see AAV31985-87), expression vectors and host cells, correspond to animals, antisense oligonucleotides, and primers useful correspond to the second of DS-CAM polypeptides are compared to severe developmental and neurological processes. They can be used in developmental and neurological abnormalities such as therapy of developmental and neurological abnormalities such as the corpus callosum, or schizencephaly. Antisense oligonucleotides created for inhibiting translation of mRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  DS-CAM1; Down syndrome-cell adhesion molecule; neural cell; signal transduction; trisomy 21; mental retardation; holoprosencephaly; corpus callosum agenesis; schizencephaly; diagnosis; assay; human; ds; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              28-SEP-1998 (first entry)

E51 was used as a probe to screen the triangle.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         and MXI. E51 was used as a probe to screen the trisomy 21 foetal brain library. 62 Clones were isolated from the 2 million clones of the original library. overlapping clones were obtained that were used to deduce a full-length sequence (see AAV31981) coding for novel hown syndrome-cell adhesion molecule DS-CAM1 (see AAW42086). A splice variant, DS-CAM2 (see AAV31988), was also identified. DS-CAM polypoptides are associated with developmental and neurological processes. The polypoptides and nucleic acids are used to develop products for the detection, diagnosis and therapy of developmental and neurological abnormalities.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 388 BP; 83 A; 119 C;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 and is deleted for the entire transmembrane domain. The DS-CAM gene spans 900-1200 kb of genomic DNA and maps at chromosome 121q22.2-22.3. The invention also provides murine DS-CAM partial 21q22.2-22.3. The invention also provides murine DS-CAM partial sequences (see AAV31985-87), expression vectors and host cells, transgenic animals, antisense oligonucleotides, and primers useful for amplification of DS-CAM nucleic acid. DS-CAM polypeptides are associated with developmental and neurological processes. They can be used in e.g. neural prosthetic devices used in entubulation methods of repairing (regenerating) damaged or severed peripheral nerves. The products can also be used in detection, diagnosis and theraps of developmental and neurological abnormalities such as the products are also be used in detection, diagnosis and theraps of developmental and neurological abnormalities such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 neural cell adh-sion molecules. A modified direct cDMA selection technique was applied to bacterial and Plantificial chromosomes between ETS2 and MX1 by using cDNA from trisomy 21 human foetal brain. A unique cDNA fragment, designated E51 (see AAV31982), was obtained and used to screen a trisomy 21 human foetal brain (14-wk gestation) cDNA library. Further clones were obtained by exon trapping, and the complete DS-CAM2 cDNA sequence was identified trapping is a splice variant of membrane-bound DS-CAM1 (see AAW42086)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated Down's Syndrome-cell adhesion molecule develop products for detection, diagnosis and therapy developmental and neurological abnormalities

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAI58190;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAI58196 standard; cDNA;
                                                                                                  The invention relates to human nucleic acids (AA157798-AA161369) and the encoded polypeptides (AAM4021-AAM42213) with nortropic, immunosuppressant and cytostatic activity. The polymiclectides are useful in gene therapy. A composition containing a polypeptide or polynuclectide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system disease, such as alzeiner's, parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        26-DEC-2000; 2000WU-US34263.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  26-JUL-2001
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WO200153312-A1

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   cDNA clones encoding each of the four CC subunits (alpha1, alpha2, beta, gamma) are now available. Various combinations of such cDNAs may be incorporated into recombinant expression systems. This allows assessment of the contribution of the different subunits to the transport and regulation of calcium ions. Availability of the cDNA and its prod. is useful in the design of therapeutic agents and diagnostic assays for diseases such as Lambert-Eaton Syndrome, involving autoimmune interactions with CCs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Rabbit skeletal muscle calcium channel gamma-subunit-encoding cDNA - useful for identification of agonists-antagonists, design of therapeutic agents and diagnostic assays for e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Disclosure;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human auxillary cytochrome
The nucleotide sequence of the cDNA coding region for the human auxillary cytochrome P450 species 2C6. The 96 to encodes a protein of 497 auxillary cytochrome P450 species 2C6. The 96 to encodes a protein of 497 amino acids. The cDNA was amplified by PCR uising the primers AQ87/63-6. The product was cloned into the yeast expression of the cytochrome P450 to produce the vectors P2D6 for the expression of the cytochrome P450 alone or p2D6R for co-expression with the yeast NADPH-P450 reductase. The vectors are used in a method for evaluating the safety of a chemical compound by reacting the chemical compound with recombinantly produced compound by reacting the chemical compound with recombinantly produced compound by reacting the chemical compound with recombinantly produced compound by reacting the chemical compound with resombinantly produced variants (AAQ87715), or 3A4 (AAQ87717) or their auxillary species and variants (AAQ87718), and yeast NADPH-P450 reductase, either as a fused variants (AAQ87718-32), and yeast NADPH-P450 reductase, either as a fused variants (AAQ87718-32), and yeast NADPH-P450 reductase, either as a fused variants (AAQ8718-32), and yeast NADPH-P450 reductase, either as a fused variants (AAQ8718-32), and yeast NADPH-P450 reductase.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    0;
```

The nucleotide sequence of the CDNA coding region for the human auxillary cytochrome P450 species 2D6 variant 1. The gene contains a change at base 886 from T to C as compared to the wild type sequence (AAQ87729). This changes the amino acid residue 296 from Cys to Arg. The CDNA was amplified by PCR using the primers AAQ87763-6. The product was cloned into the yeast expression vectors pAAH5N or pAHRR to produce the vectors p2D6 variant 1 for the expression of the cytochrome P450 alone

The vectors are used in a method for evaluating the safety of a chemical compound by reacting the chemical compound with recombinantly produced human cycochrome P450 molecular species 12 (AAQ87714), 209 produced human (AAQ87716), or 3A4 (AAQ87717) or their auxillary species (AAQ87715), 2E1 (AAQ87718-32), and yeast NADDH-P450 reductase, either as a and variants (AAQ87718-32), and yeast NADDH-P450 reductase, either as a land variants (AAQ87718-32), and yeast NADDH-P450 reductase, either as a converted in cell extracts, and analysing the resulting metabolite to assess the safety of the chemical compound. The metabolite, will be determining whether the chemical compound, or its metabolite, will be converted into a carcinogenic or mutagenic form through metabolism in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human cytochrome P450; amplification; PCR: yeast NAUPH-P450 reductase; safety; fusion carcinogen; mutagen; liver metabolism; ds.

CC change at base 1457 from C to G as compared to the wild type sequence of the CDNA coding region for the human CC change at base 1457 from C to G as compared to the wild type sequence CC change at base 1457 from C to G as compared to the wild type sequence CC change at base 1457 from C to G as compared to the wild type sequence CC cDNA was amplified by PCR using the primers AAO87763-6. The product was CC cDNA was amplified by PCR using the primers AAO87763-6. The product was compared into the yeast expression vectors AAO87763-6. The produce the vectors p2D6 v.riant 3 for the expression of the cyto-hrome P450 alone or p2D6R variant 3 for co-expression with the yeast NADPH-P450 cor pedBR variant 3 for co-expression with the yeast NADPH-P450 of reductase. The vectors are used in a method for evaluating the safety of CC produced human cytochrome P450 molecular species 1A2 (AAO87714), 2C9 cc produced human cytochrome P450 molecular species 1A2 (AAO87714), 2C9 cc (AAO87715), 2E1 (AAO87715), or 3A4 (AAO87717) or their auxillary species CC (AAO87715), 2E1 (AAO87718-32), and yeast NADPH-P450 reductase, either as a cc and variants (AAO87718-32), and yeast NADPH-P450 reductase, either as a cc fused protein or in cell extracts, and analysing the resulting metabolite to assess the safety of the chemical compound. The method is useful for determining whether the chemical compound, or its metabol will be converted into a carcinogenic or mutagenic form through metabolism in the
                                                                                                                                                         Qγ
                                                                                                                                                                                                          Dβ
                                                                                                                                                                                                                                                 Ş
